

Mid Sprint – SD12 – Noah Devine’s perspective

Question 1: How it went:

- For the most part, this project went well. We met every morning between 9-9:30 to lay out what we were going to tackle for the day, what needed to be addressed, and any potential blockers we might run into. We have worked together since semester one and I believe we work very well as a team. We are very results driven and if one of us struggles with something, the other two are there to help the person out. I know myself I need to thank Laura and Chris for their hard work and dedication to making these projects go as seamless as possible. We did run into some confusing issues while setting up the API portion of this project and we had to ask more questions regarding this project more than any other project we have done.

Question 2: What was good?

- We worked well as a team, the CLI portion of this project was a lot easier than the API end of it. We met every morning to discuss the game plan for the day and tackled any issues that we came across. We are a solid team who gets things done

Question 3: What went bad?

- We had some issues with the API portion of the project. Specifically, with the relationship’s direction between cities and airports. We just had some general confusion with the project requirements as well but were able to overcome it by asking questions when needed. Also had some small issues answering some of the CLI questions but Chris and Laura were able to help me out with it.

Question 4: What could you improve?

- Our communication skills can always be improved to avoid confusion; we could also split up the work differently to meet all our different strengths and weaknesses, but sometimes that just happens but we always make it work.
